

7. Building Compilers with Coco/R

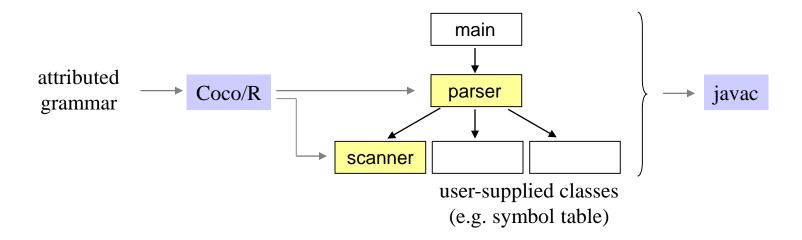

7.1 Overview

- 7.2 Scanner Specification
- 7.3 Parser Specification
- 7.4 Error Handling
- 7.5 LL(1) Conflicts
- 7.6 Example

Coco/R - Compiler Compiler / Recursive Descent

Generates a scanner and a parser from an ATG

Scanner DFA

Parser Recursive Descent

Origin 1980, built at the University of Linz

Current versions for Java, C#, C++, VB.NET, Delphi, Modula-2, Visual Basic, Oberon, ...

Open source http://ssw.jku.at/Coco/

Similar tools Lex/Yacc, JavaCC, ANTLR, ...

Example: Compiler for Arithmetic Expressions

COMPILER Calc

```
CHARACTERS
digit = '0' .. '9'.

TOKENS
number = digit {digit}.

COMMENTS FROM "//" TO cr If
COMMENTS FROM "/*" TO "*/" NESTED
IGNORE '\t' + '\r' + '\n'
```

Scanner specification

```
PRODUCTIONS
  Calc
                           (. int x; .)
                           (. System.out.println(x); .) .
  = "CALC" Expr<out x>
  Expr <out int x>
                           (. int y; .)
  = Term<out x>
                           (. X = X + y; .)
     { '+' Term<out y>
  Term <out int x>
                           (. int y; .)
  = Factor<out x>
      '*' Factor<out y> (. x = x * y; .)
  Factor < out int x>
                           (.x = Integer.parseInt(t.val); .)
  = number
    '(' Expr<out x> ')'.
```

Parser specification

END Calc.

Structure of a Compiler Description

ident denotes the start symbol of the grammar (i.e. the topmost nonterminal symbol)

7. Building Generators with Coco/R

- 7.1 Overview
- 7.2 Scanner Specification
- 7.3 Parser Specification
- 7.4 Error Handling
- 7.5 LL(1) Conflicts
- 7.6 Example

Structure of a Scanner Specification

ScannerSpecification =

["IGNORECASE"]

["CHARACTERS" {SetDecl}]

["TOKENS" {TokenDecl}]

["PRAGMAS" {PragmaDecl}]

{CommentDecl}

{WhiteSpaceDecl}.

Should the generated compiler be case-sensitive?

Which character sets are used in the token declarations?

Here one has to declare all structured tokens (i.e. terminal symbols) of the grammar

Pragmas are tokens which are not part of the grammar

Here one can declare one or several kinds of comments for the language to be compiled

Which characters should be ignored (e.g. \t , \n , $\$)?

Character Sets

Example

CHARACTERS

digit = "0123456789".
hexDigit = digit + "ABCDEF".

letter = 'A' .. 'Z'.

eol = '\n'.

noDigit = ANY - digit.

the set of all digits

the set of all hexadecimal digits

the set of all upper-case letters

the end-of-line character

any character that is not a digit

Valid escape sequences in character constants and strings

\\ backslash \r carriage return \f form feed

' apostrophe \n new line \a bell

\" quote \t horizontal tab \b backspace

\0 null character \v vertical tab \uxxxx hex character value

Coco/R allows Unicode (UTF-8)

Token Declarations

Define the structure of *token classes* (e.g. ident, number, ...)

Literals such as "while" or ">=" don't have to be declared

Example

no problem if alternatives start with the same character

- Right-hand side must be a regular EBNF expression
- Names on the right-hand side denote character sets

Pragmas

Special tokens (e.g. compiler options)

- can occur anywhere in the input
- are not part of the grammar
- must be semantically processed

Example

Compiler options (e.g., \$AB) that can occur anywhere in the code

whenever an *option* (e.g. \$ABC) occurs in the input, this semantic action is executed

Typical applications

- compiler options
- preprocessor commands
- comment processing
- end-of-line processing

Comments

Described in a special section because

- nested comments cannot be described with regular grammars
- must be ignored by the parser

Example

COMMENTS FROM "/*" TO "*/" NESTED COMMENTS FROM "//" TO "\r\n"

White Space and Case Sensitivity

White space

Case sensitivity

Compilers generated by Coco/R are case-sensitive by default

Can be made case-insensitive by the keyword IGNORECASE

```
COMPILER Sample
IGNORECASE

CHARACTERS
  hexDigit = digit + 'a'..'f'.
...

TOKENS
  number = "0x" hexDigit hexDigit hexDigit hexDigit.
...

PRODUCTIONS
  WhileStat = "while" '(' Expr ')' Stat.
...

END Sample.
```

Will recognize

- 0x00ff, 0X00ff, 0X00FF as a number
- while, WHILE as a keyword

Token values returned to the parser retain their original casing

Interface of the Generated Scanner

main method: returns a token upon every call

reads ahead from the current scanner position without removing tokens from the input stream

resets peeking to the current scanner position

7. Building Generators with Coco/R

- 7.1 Overview
- 7.2 Scanner Specification
- 7.3 Parser Specification
- 7.4 Error Handling
- 7.5 LL(1) Conflicts
- 7.6 Example

Productions

- Can occur in any order
- There must be exactly 1 production for every nonterminal
- There must be a production for the start symbol (the grammar name)

Example

```
COMPILER Expr
...

PRODUCTIONS

Expr = SimExpr [RelOp SimExpr].

SimExpr = Term {AddOp Term}.

Term = Factor {Mulop Factor}.

Factor = ident | number | "-" Factor | "true" | "false".

RelOp = "==" | "<" | ">".

AddOp = "+" | "-".

MulOp = "*" | "/".

END Expr.
```

Arbitrary context-free grammar in EBNF

Semantic Actions

Arbitrary Java code between (. and .)

```
IdentList
(. int n; .)
local semantic declaration

= ident
(. n = 1; .)
semantic action

{ ',' ident
(. n++; .)

}
(. System.out.println(n); .)
```

Semantic actions are copied to the generated parser without being checked by Coco/R

Global semantic declarations

```
import java.io.*;

COMPILER Sample

FileWriter w;

void Open(string path) {
    w = new FileWriter(path);
    ...
}

PRODUCTIONS
Sample = ... (. Open("in.txt"); .)

END Sample.

import of classes from other packages

global semantic declarations
(become fields and methods of the parser)

semantic actions can access global declarations as well as imported classes
```

Attributes

For terminal symbols

- terminal symbols do not have explicit attributes
- their values can be accessed in sem. actions using the following variables declared in the parser

```
Token t; the most recently recognized token
```

Token **Ia**; the lookahead token (not yet recognized)

Example

For nonterminal symbols

• NTS can have any number of input attributes

```
formal attr.: A < int x, char c > = ... actual attr.: ... A < y, 'a' > ...
```

• NTS can have at most <u>one</u> output attribute (must be the first in the attribute list)

```
B < out int x, int y> = ....
```

Productions are Translated to Parsing Methods

Production

```
Expr<out int n> (. int n1; .)

= Term<out n>
{ '+'
    Term<out n1> (. n = n + n1; .)
}.
```

Resulting parsing method

```
int Expr() {
    int n;
    int n1;
    n = Term();
    while (la.kind == 3) {
        Get();
        n1 = Term();
        n = n + n1;
    }
    return n;
}
```

Attributes => parameters or return values Semantic actions => embedded in parser code

The symbol ANY

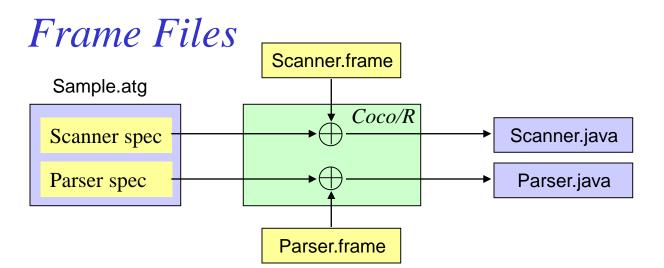

Denotes any token that is not an alternative of this ANY symbol

Example: counting the number of occurrences of *int*

Example: computing the length of a block

Example: counting statements in a block

Scanner.frame snippet

```
public class Scanner {
    static final char EOL = '\n';
    static final int eofSym = 0;
-->declarations
...
    public Scanner (InputStream s) {
        buffer = new Buffer(s);
        Init();
    }
    void Init () {
        pos = -1; line = 1; ...
-->initialization
    ...
}
```

- Coco/R inserts generated parts at positions marked by "-->..."
- Users can edit the frame files for adapting the generated scanner and parser to their needs
- Frame files are expected to be in the same directory as the compiler specification (e.g. *Sample.atg*)

Interface of the Generated Parser

```
public class Parser {
  public Scanner scanner; // the scanner of this parser
  public Errors errors; // the error message stream
  public Token t; // most recently recognized token
  public Token la; // lookahead token
  public Parser (Scanner scanner);
  public void Parse ();
  public void SemErr (String msg);
}
```

Parser invocation in the main program

```
public class MyCompiler {
   public static void main(String[] arg) {
        Scanner scanner = new Scanner(arg[0]);
        Parser parser = new Parser(scanner);
        parser.Parse();
        System.out.println(parser.errors.count + " errors detected");
   }
}
```

7. Building Generators with Coco/R

- 7.1 Overview
- 7.2 Scanner Specification
- 7.3 Parser Specification
- 7.4 Error Handling
- 7.5 LL(1) Conflicts
- 7.6 Example

Syntax Error Handling

Syntax error messages are generated automatically

For invalid terminal symbols

```
production S = a b c.
input a x c
error message -- line ... col ...: b expected
```

For invalid alternative lists

```
production S = a (b | c | d) e.

input a \times e

error message -- line ... col ...: invalid S
```

Error message can be improved by rewriting the production

```
productions S = a T e.

T = b | c | d.

input a \times e

error message -- line ... col ...: invalid T
```

Syntax Error Recovery

The user must specify synchronization points where the parser should recover

```
Statement synchronization points

= SYNC

( Designator "=" Expr SYNC ';'
| "if" '(' Expression ')' Statement ["else" Statement]
| "while" '(' Expression ')' Statement
| '{' {Statement} '}'
| ...
).
```

What happens if an error is detected?

- parser reports the error
- parser continues to the next synchronization point
- parser skips input symbols until it finds one that is expected at the synchronization point

```
while (la.kind is not accepted here) {
    la = scanner.Scan();
}
```

What are good synchronization points?

Points in the grammar where particularly "safe" tokens are expected

- start of a statement: if, while, do, ...
- start of a declaration: public, static, void, ...
- in front of a semicolon

Semantic Error Handling

Must be done in semantic actions

SemErr method in the parser

```
void SemErr (String msg) {
    ...
    errors.SemErr(t.line, t.col, msg);
    ...
}
```

Errors Class

Coco/R generates a class for error message reporting

```
public class Errors {
  public int count = 0;
                                                             // number of errors detected
  public PrintStream errorStream = System.out; // error message stream
  public String errMsgFormat = "-- line {0} col {1}: {2}";  // 0=line, 1=column, 2=text
  // called by the programmer (via Parser.SemErr) to report semantic errors
  public void SemErr (int line, int col, String msg) {
    printMsg(line, col, msg);
    count++;
 // called automatically by the parser to report syntax errors
  public void SynErr (int line, int col, int n) {
    String msg;
    switch (n) {
      case 0: msg = "..."; break;
      case 1: msg = "..."; break; syntax error messages generated by Coco/R
    printMsg(line, col, msg);
    count++;
```

7. Building Generators with Coco/R

- 7.1 Overview
- 7.2 Scanner Specification
- 7.3 Parser Specification
- 7.4 Error Handling
- 7.5 LL(1) Conflicts
- 7.6 Example

Coco/R finds LL(1) Conflicts automatically (55W)

Example

```
PRODUCTIONS
  Sample
             = {Statement}.
  Statement = Qualident '=' number ':'
                Call
                "if" '(' ident ')' Statement ["else" Statement].
             = ident '(' ')' ':'.
  Call
  Qualident = [ident '.'] ident.
```

Coco/R produces the following warnings

```
>coco Sample.atg
Coco/R (Sep 19, 2015)
checking
  Sample deletable
  LL1 warning in Statement: ident is start of several alternatives
  LL1 warning in Statement: "else" is start & successor of deletable structure
  LL1 warning in Qualident: ident is start & successor of deletable structure
parser + scanner generated
0 errors detected
```

Conflict Resolution by Multi-symbol Lookahead

```
A = ident (. x = 1; .) {',' ident (. x++; .) } ':' | ident (. Foo(); .) {',' ident (. Bar(); .) } ';'.
```

Resolution

```
A = IF (FollowedByColon())
ident (. x = 1; .) {',' ident (. x++; .) } ':'
| ident (. Foo(); .) {',' ident (. Bar(); .) } ';'.
```

Resolution method

```
boolean FollowedByColon() {
   Token x = la;
   while (x.kind == _ident || x.kind == _comma) {
      x = scanner.Peek();
   }
   return x.kind == _colon;
}
```

```
TOKENS
ident = letter {letter | digit}.
comma = ','.
...

static final int
_ident = 17,
```

comma = 18,

Conflict Resolution by Semantic Information

```
Factor = '(' ident ')' Factor /* type cast */
| '(' Expr ')' /* nested expression */
| ident
| number.
```

Resolution

Resolution method

```
boolean IsCast() {
   Token next = scanner.Peek();
   if (la.kind == _lpar && next.kind == _ident) {
      Obj obj = Tab.find(next.val);
      return obj.kind == Obj.Type;
   } else return false;
}
```

returns true if '(' is followed by a type name

7. Building Generators with Coco/R

- 7.1 Overview
- 7.2 Scanner Specification
- 7.3 Parser Specification
- 7.4 Error Handling
- 7.5 LL(1) Conflicts
- 7.6 Example

Example: Query Form Generator

Input: A domain-specific language for describing query forms

```
RADIO "How did you like this course?"

("very much", "much", "somewhat", "not so much", "not at all")

CHECKBOX "What is the field of your study?"

("Computer Science", "Mathematics", "Physics")

TEXTBOX "What should be improved?"

...
```

Output: HTML query form

How did you like this course?	
overy much	
○ much	
○ somewhat	
O not so much	
not at all	
What is the field of your study? Computer Science Mathematics Physics	
What should be improved?	
	^
	~

To do

- 1. Describe the input by a grammar
- 2. Define attributes for the symbols
- 3. Define semantic routines to be called
- 4. Write an ATG

Input Grammar

```
RADIO "How did you like this course?"
("very much", "much", "somewhat",
  "not so much", "not at all")

CHECKBOX "What is the field of your study?"
("Computer Science", "Mathematics", "Physics")

TEXTBOX "What should be improved?"
```

Attributes

- Caption returns a string
 Caption cout String s>
- Values returns a list of strings
 Values
 Values

Semantic routines

- printHeader()
- printFooter()
- printRadio(caption, values)
- printCheckbox(caption, values)
- printTextbox(caption)

implemented in a class HtmlGenerator

Scanner Specification

```
COMPILER QueryForm

CHARACTERS
noQuote = ANY - '"'.

TOKENS
string = ""' {noQuote} '"'.

COMMENTS
FROM "//" TO "\r\n"

IGNORE '\t' + '\r' + '\n'
...

END QueryForm.
```

Parser Specification

```
import java.util.ArrayList;
COMPILER QueryForm
  HtmlGenerator html:
PRODUCTIONS
QueryForm =
                              (. html.printHeader(); .)
                        (. html.printFooter(); .)
  { Query }
                      (. String caption; ArrayList values; .)
Querv
= "RADIO" Caption<out caption> Values<out values>
                              (. html.printRadio(caption, values); .)
 "CHECKBOX" Caption<out caption> Values<out values>
                               (. html.printCheckbox(caption, values); .)
 "TEXTBOX" Caption<out caption>
                      (. html.printTextbox(caption); .) .
Caption<out String s> = StringVal<out s>.
Values<out ArrayList values> (. String s; .)
= '(' StringVal<out s> (. values = new ArrayList(); values.add(s); .) (. values.add(s); .)
StringVal<out String s>
                            (. s = t.val.substring(1, t.val.length()-1); .)
= string
END QueryFormGenerator.
```

Class HtmlGenerator

```
import java.io.*;
import java.util.ArrayList;
class HtmlGenerator {
  PrintStream s:
  int itemNo = 0;
  public HtmlGenerator(String fileName) throws FileNotFoundException {
    s = new PrintStream(fileName);
  public void printHeader() {
    s.println("<html>");
    s.println("<head><title>Query Form</title></head>");
    s.println("<body>");
    s.println(" <form>");
  public void printFooter() {
    s.println(" </form>");
    s.println("</body>");
    s.println("</html>");
    s.close();
```

Class HtmlGenerator (continued)

```
public void printRadio(String caption, ArrayList values) {
  s.println(caption + "<br>");
  for (Object val: values) {
     s.print("<input type='radio' name='Q" + itemNo + "' ");
                                                                          <input type='radio' name='Q0'
                                                                             value='very much'>very much<br>
     s.print("value="" + val + "'>" + val + "<br>");
    s.println();
  itemNo++; s.println("<br/>);
public void printCheckbox(String caption, ArrayList values) {
  s.println(caption + "<br>");
                                                                          <input type='checkbox' name='Q1'
                                                                             value='Mathematics'>Mathematics<br>
  for (Object val: values) {
     s.print("<input type='checkbox' name='Q" + itemNo + "' ");
    s.print("value="" + val + "'>" + val + "<br>");
    s.println();
  itemNo++; s.println("<br>");
                                                                          <textarea name='Q2' cols='50' rows='3'>
public void printTextbox(String caption) {
                                                                          </textarea><br>
  s.println(caption + "<br>");
  s.println("<textarea name='Q" + itemNo + "' cols='50' rows='3'></textarea><br>");
  itemNo++; s.println("<br>");
```

Main Program

Tasks

- Read command-line arguments
- Create and initialize scanner and parser
- Start the parser

```
import java.io.*;
class MakeQueryForm {
  public static void main(String[] args) {
    String inFileName = args[0];
    String outFileName = args[1];
    Scanner scanner = new Scanner(inFileName);
    Parser parser = new Parser(scanner);
    try {
       parser.html = new HtmlGenerator(outFileName);
       parser.Parse();
      System.out.println(parser.errors.count + " errors detected");
    } catch (FileNotFoundException e) {
      System.out.println("-- cannot create file " + outFileName);
```

Putting it All Together

Run Coco/R

java -jar Coco.jar QueryForm.ATG

Scanner.java, Parser.java

Compile everything

javac Scanner.java Parser.java HtmlGenerator.java MakeQueryForm.java

Run the Query Form Generator

java MakeQueryForm input.txt output.html

Summary

Compiler-generating tools like Coco/R can always be applied if

- some input is to be transformed into some output
- the input is syntactically structured

Typical applications

- static program analyzers
- metrics tools for source code
- source code instrumentation
- domain-specific languages
- log file analyzers
- data stream processing
- ...
